I've seen some chatter in the archives about the failure to render infoboxes, but it seems to me that the problem is much more widespread than that. I have looked around and every WP article with tables that I have checked have had the tables excluded in the .pdf print/export version. That is to say, after looking around, I have yet to find ANY tables that are rendered in the .pdf generated by print/export. Yes, there are many articles without tables, nevertheless, many articles include critical information in the articles and the lack of tabular information renders (pun intended) the .pdf nearly worthless. This is a widespread problem that IMHO should be prioritized relatively high. In the last two weeks, I've had two users new of my script enquiring about loading problems. They describe a sequence of events that seem improbable, given that my script has been well tested and any fatal bugs rapidly patched, and I cannot replicate the loading problems within my own userspace. The script seems to behave inconsistently between vector.js and monobook.js environments. First was this. The script didn't work in vector but was eventually made to work in monobook. I never thought the syntax - `importScript('PATHNAME.js');` or `importScript("PATHNAME.js");` - mattered, as I have both single quotes and double quotes inside my vector file and there are no problems with script importations. Then, earlier today, another user reported that the script apparently loads, and the sidebar buttons appear, but clicking on it only results only in a new edit summary. Now given that the function that inserts the edit summary of my MOSNUM script is the last to execute, yet earlier-placed functions do not execute on a given article as well; the instruction (i.e. `doaction('diff');`) that follows the edit summary insertion is not executed, it seems highly illogical behaviour. Any idea... 6ce0b3c849
